PyCity School Analysis

Overall, Charter schools perform more efficiently than the District schools. If you take a look at the Top 5 best overall performing schools, it is all Charter schools. Charter schools have fewer students and a smaller budget than the district schools. Typically Charter schools intend to provide a better education to their students simply because Charter schools are typically privately owned so the tuition is high unlike the district schools are publicly owned and free for students.

Although the Charter schools perform better. Overall, the scores and averages for the whole district are fair and not bad. With the reading scores averaging 81.87 and math scores averaging 78.98. Charter schools are smaller in size too which I can presume that teachers can focus better teaching a smaller classroom than larger ones. Schools with less than 1000 students average 83% in both math and reading while large schools average 77% in math and 81% in reading.

In conclusion, the charter schools have better passing rates than district schools, with their budgets smaller but it shows more efficiency than any other school. Passing rates of 93% in math and 96% in reading. District shows 66% passing math and 80% passing reading. My recommendation for the school board is to invest more money and allocate more resources to district schools so students may engage better in school, teachers may have more resources or simply replace them with better instructors.
